Foreword

In 2008, Wayne County began work in support of the negotiation of two related service agreements for the Rouge Valley Sewage Disposal System (RVSDS): a new service agreement between Wayne County and the City of Detroit for disposal of wastewater from the RVSDS, and a new service agreement between Wayne County and RVSDS customers for wastewater transport and disposal.

During the period March 2009 through November 2011, Wayne County completed technical analyses in support of the new service agreements under two guiding principles: consistent and high quality data sources would be used to characterize customer communities; and a technically sound and equitable method for allocating capacity would be developed and used to determine new contractual capacities. Wayne County and RVSDS customers met numerous times during this period to review data, assumptions, and methodologies used in the technical analyses. RVSDS customers were also provided multiple drafts of each document for review and comment. The technical analyses completed in support of the RVSDS service agreement negotiations are summarized in three related reports:

1. District Characteristics, dated April 26, 2012;
2. Allocation of Wastewater Capacity, dated April 26, 2012; and
3. District Wastewater Transport Capacity, dated May 21, 2012.

In addition, Wayne County has been conducting flow monitoring and other analysis of the RVSDS in support of system operations for a number of years. System analysis and other work is also ongoing as necessary for compliance with Final Order of Abatement 2117 (AFO-SW12-002) (FOA), as amended, entered with the Michigan Department of Environmental Quality (MDEQ). Construction of the Short-Term Corrective Action Plan (STCAP) was completed in the spring of 2012 to reduce interceptor system inflow and infiltration and improve the transport capacity of the interceptor system. Work included pipe lining, pipe grouting, manhole repairs, improvements at comfort stations, and a new siphon downstream of Lift Station 1A (LS1A). Monitoring of the effects of the STCAP improvements on RVSDS flows began on July 1, 2012 and continues to date.

In 2014, work began on development of a Long-Term Corrective Action Plan (LTCAP) to implement improvements to the RVSDS necessary to reduce sanitary sewer overflow (SSO) discharges as required by the FOA and to provide system integrity and longevity. As part of the LTCAP study, the hydrologic and hydraulic computational model of the RVSDS interceptor system was updated and each line connection and its service area was identified. These service areas were also split by sewer type (combined, separate, or storm) and by community

boundaries. Many of the same community level district characteristics presented in this supplement were determined for each line connection service area in support the hydrologic/hydraulic model update. These line connection service area results are presented in an appendix to this supplement.

1. EXECUTIVE SUMMARY

This document presents updates to select characteristics of the RVSDS service area including population, employment, housing, and land use. These updated characteristics are based on the 2010 Census, recent SEMCOG projections, and a year 2008 land use coverage prepared by SEMCOG that recently became available. Please consult the 2012 RVSDS District Characteristics report for other service area characteristics. Also, the quarterly and annual system flow monitoring reports available online at <http://waynecounty.com/doe/1108.htm>.

In April 2012, Wayne County published the report “District Characteristics” for the Rouge Valley Sewage Disposal System (RVSDS). The district characteristics data presented included population, housing, employment, and land use for each community in the RVSDS based on the Census 2000 and a year 2000 land use coverage that were available at the time. The 2012 District Characteristics report also includes other characteristics of the RVSDS communities, a summary of the RVSDS wastewater flow rates, and an analysis of wastewater capacity needs in the RVSDS.

This “Supplement 1” report provides updates to select RVSDS community characteristics based on currently available information. Additionally, select district characteristics are also presented for the area served by each community connection to the RVSDS interceptor system. The breakdown of characteristics by line connection is being used for an updated hydrologic/hydraulic model of the RVSDS interceptor system. Other service area characteristics remain available from the 2012 RVSDS District Characteristics report.

The RVSDS transports wastewater from 14 communities in Wayne County, in 3 communities in Oakland County and 1 community in Washtenaw County to the City of Detroit’s Wastewater Treatment Plant for treatment and disposal. The RVSDS boundary is shown on Figure 1 and Table 1 presents a listing of the communities served all or partly by the RVSDS.

The RVSDS was formed in August 1961 through an agreement between the City of Detroit and Wayne County for transport and treatment of wastewater from the RVSDS. An agreement between Wayne County and the customer communities at the time was also made in August 1961 for transport of wastewater from the customer communities to the Detroit wastewater collection system. The agreements between Wayne County and the customer communities were amended in 1983, 1984 and 1988 to adjust contractual capacities, the RVSDS boundary, communities served, and to assign cost allocations for interceptor system improvements. Negotiation of new service agreements between Wayne County and Detroit, and between Wayne County and customer communities, for the RVSDS services are currently underway.

In 1988, three communities (Canton, Northville and Plymouth Townships) formed the Western Townships Utility Authority (WTUA). WTUA operates an interceptor system and two equalization basins and also has an agreement for sewage disposal with the Ypsilanti Community Sewer Authority (YCUA). The WTUA communities split their wastewater discharges between the RVSDS and the YCUA connections. In the past 4 years, from 29.0% to 47.8% of the wastewater from the WTUA communities has been discharged to the RVSDS.

In 2007, a gated diversion chamber and connection to the RVSDS from the interceptor that delivers wastewater to the Walled Lake Wastewater Treatment Plant was constructed. This diversion was used to send peak flow rates on an emergency basis to the RVSDS from parts of Novi and Commerce Township and all of Wolverine Lake. The diversion is now closed and the diversion area is not included in the RVSDS boundary or community characteristics presented in this Supplement 1 to the 2012 RVSDS District Characteristics report.

Table 2 presents a summary of the characteristics of the communities which contribute wastewater flows to the RVSDS. Information is given for the entire WTUA communities. Information is given for the parts of Dearborn Heights, Inkster, Romulus and Van Buren Township that are within the RVSDS boundary. The data for Novi excludes Novi Township.

2. DISTRICT BOUNDARY

The RVSDS is served by two Wayne County interceptor systems. The Middle Rouge Interceptor system runs along the Middle Branch of the Rouge River from Northville to Dearborn and serves parts of Canton Township, Dearborn Heights, Novi, Redford Township, Salem Township and Westland and all of Garden City, Livonia, Plymouth, Plymouth Township, Northville, and Northville Township. The Lower Rouge Interceptor system runs along Michigan Avenue and the Lower Branch of the Rouge River from Canton Township to Dearborn. It serves parts of Canton Township, Dearborn Heights, Inkster, Romulus, Westland, and Van Buren Township and all of Wayne. The sewer service areas of Canton Township, Dearborn Heights and Westland are split between the two interceptor systems.

Figure 1 depicts the RVSDS boundary along with the boundary of the WTUA service area, areas tributary via industrial contributions only, and non-contributing areas in the Rouge River floodplain. The District includes 126,844 acres of land in the communities and, 4,881 acres of land at the Detroit Metropolitan Wayne County Airport. Therefore, the total acreage of land tributary to the RVSDS is 131,726 acres.

The RVSDS boundary shown in Figure 1 was developed by refining the boundary presented in the Detroit Water and Sewerage Department (DWSD) 2003 Wastewater Master Plan.

Refinements to the boundary shown in the DWSD Master Plan were made based on information from the 2003 Greater Detroit Regional Sewer System (GDRSS) Storm Water Management Model (SWMM) tributary area map. Additionally, the RVSDS boundary was updated for Dearborn Heights, Inkster, Novi, Redford Township, Romulus, Salem Township, and Van Buren Township, based on community provided sewer maps and GIS data.

Salem Township in Washtenaw County historically has not been served by the RVSDS. The Veolia Environmental Services-Arbor Hills West Landfill, which is in Salem Township along the border with Northville Township, currently discharges its leachate through Northville Township to the RVSDS. This area is shown within the RVSDS boundary. However, data for Salem Township is not included in the analysis of district characteristics as the discharge is considered an industrial contribution to the RVSDS.

Novi Township is excluded from the RVSDS since wastewater service is provided by septic systems.

There are three areas in the RVSDS where wastewater is discharged to both the RVSDS and to other wastewater systems. They are:

- 1.) *WTUA Communities* – The wastewater from the WTUA communities is equalized and discharged to both the YCUA system and the RVSDS. The split of the wastewater between the systems varies depending on weather conditions and other factors. The WTUA communities do not have areas that are dedicated to either system. Therefore, the characteristics for the entire WTUA communities are given in this memorandum. The landfill leachate from Salem Township is part of the WTUA flows.
- 2.) *Van Buren Township* – The peak wet weather flow rates that exceed the maximum allowable flow limits for Van Buren Township are diverted to an equalization basin which discharges to the Downriver Sewage Disposal System (DSDS).
- 3.) *Detroit Metropolitan Wayne County Airport (DTW)* – Wastewater from DTW, which is operated by the Wayne County Airport Authority (WCAA), is currently discharged to the DSDS. In 2009, Wayne County and the WCAA executed an agreement which provides that WCAA can discharge up to 1 MGD (1.55 cfs) of spent aircraft deicing fluid mixed with storm water to the RVSDS as an alternative outlet for proper disposal when conditions do not allow the WCAA to discharge into the DSDS. The agreement provides for discharge into the RVSDS only during specified dry weather and other conditions. WCAA's outlet to the RVSDS connects to the Wayne Interceptor at Venoy Road. The Airport covers about 4,881 acres. District characteristics for the RVSDS presented in this report do not include data for the WCAA since their wastewater discharge is considered an industrial contribution to the RVSDS.

3. SERVICE AREA CHARACTERISTICS

This section describes the sources of the data and select characteristics of the RVSDS. Population and housing information were obtained from the U.S. Bureau of Census. The most recent data available are from the 2010 Census. Table 3 summarizes the Census data availability for the RVSDS.

Data sets obtained from the U.S. Bureau of Census are derived from two resolutions of surveys. The first, known as “100% data”, are values that were derived from the primary questionnaire distributed to every household. The second, known as “sample data”, are values that were derived from a more detailed secondary questionnaire that was distributed to 1/6th of households. The Census data is available for the following geographical subdivisions from coarsest to finest: Nation, State, County, Minor Civil Division (City or Township), Tract, Block Group, and Block. For the analysis presented herein, the finest subdivision available was utilized.

Electronic geographic (“shape”) files for block groups and blocks were downloaded from the Topologically Integrated Geographic Encoding and Referencing system (TIGER) from the U.S. Census Bureau website. These files were used as the basis for joining the population and housing information from the Census data sets, which are delivered in a tabular format, to the geographical coverage each row represents.

The Southeast Michigan Council of Governments (SEMCOG) website provided Community Profile reports. These reports contain historic, current, and forecasted information on demographics, employment, housing, and land usage for each community that belongs to SEMCOG and were downloaded on February 4, 2015 from the SEMCOG website. In addition to these reports, the year 2008 Regional Land Use shape and data files were obtained from SEMCOG.

Population, employment, housing unit, and land use data were also tabulated for each RVSDS flow meter district and for each community line connection to the interceptor. Figure 2 presents a map showing the boundaries for both the meter districts and the line connections. In Figure 2, meter district identification numbers are shown in [brackets], and line connection identification numbers are shown without brackets. White areas on the figure represent non-contributing or un-sewered areas. Appendices A and B contain the characteristics for each RVSDS flow meter district and each community line connection, respectively. Figures A1 through A8 present the flow meter and line connection locations throughout the RVSDS interceptor system.

ArcMap 10.2 software was used to overlay the RVSDS boundaries with the Census and SEMCOG information and perform an intersect. For Census areas that were divided by an RVSDS boundary, an even density by area was used to distribute the Census value.

a) Population

Table 4 details the year 2010 residential population for each of the RVSDS communities. The population projections every ten years through year 2040 are also given in Table 4 for each RVSDS community. These population estimates were taken from the SEMCOG Community Profiles and are only provided at the entire community level. For the communities that are only partially tributary to the RVSDS, the population projections for future years were calculated using the percentage of the year 2010 population of the community within the RVSDS. The percentage of population in the RVSDS for these communities is presented in Table 5.

b) Employment

Employment estimates for the RVSDS are provided in Table 6 every five years for the period 2000 through 2040. Employment information was taken from the SEMCOG Community Profiles and is only provided at the entire community level. The employment for the communities that are only partially tributary to the RVSDS was estimated by using the percentage of non-residential developed area in the RVSDS to the total non-residential developed area in the community. The non-residential developed area was defined as all land area classified with a 2008 SEMCOG land use of commercial, industrial, or institutional. The percentage of non-residential developed area in the RVSDS for these communities is presented in Table 5.

c) Housing Units

The Census 2010 housing unit data for the RVSDS is presented in Table 7. As of 2005, housing characteristic data is no longer handled directly by the U.S. Census Bureau as part of the decennial census. This information is now collected and compiled separately by the American Community Survey (ACS) on a yearly basis. Although this information is now kept up to date, the ACS uses a much smaller sample group of 1% of the United States compared to 17% surveyed in the 2000 Census. Because of its larger sample size, the 2000 Census housing characteristic data was determined for the service area of each line connection and advanced using housing built between 2000 and 2010, assuming this to be the difference between the total housing unit count for the year 2000 and 2010 Census', when positive. If the total housing unit count decreased, these houses were assumed to have been removed from the count in the oldest category for that area.

Percentages of population in the RVSDS, from Table 5 were used to estimate number of housing units in the District shown in Table 7 for the communities that are only partially tributary to the RVSDS. Homes built before 1970 likely have footing drains connected to the sanitary sewer system, and therefore the percentage of homes built pre-1970 was estimated.

d) Land Use

Land use coverage for year 2008 is provided on Figure 3 and the land use breakdown is given in Table 11 for the area of each community in the RVSDS. The SEMCOG 2008 Regional Land Use shape and data files were overlaid with the RVSDS and community boundaries to determine the land use breakdown for year 2008. The land use for Dearborn Heights, Inkster, Novi, Romulus and Van Buren Township is shown for the portions of these communities within the RVSDS. The RVSDS contains 131,726 acres, with about 98,693 acres of developed land and 33,033 acres of undeveloped land. There are 61,166 acres of residential property in the RVSDS which is 62% of the total developed land area.

The SEMCOG land use data available today differs greatly from the SEMCOG 2000 Regional Land Use data utilized in the 2012 RVSDS District Characteristics report. The main differences are how the land use areas were delineated and the treatment of roads. The 2000 land use was delineated solely using aerial photography and could be also considered a “land cover” map. For the 2008 land use data, the land use information was completely re-determined using parcel data provided by each community. First, the tax, zoning, and ownership information from each parcel was used to determine an appropriate category, and then the chosen land uses were verified through an overlay with an aerial map. However, once determined, the entire parcel would be categorized as a single land use regardless of how much of the parcel is actually being utilized.

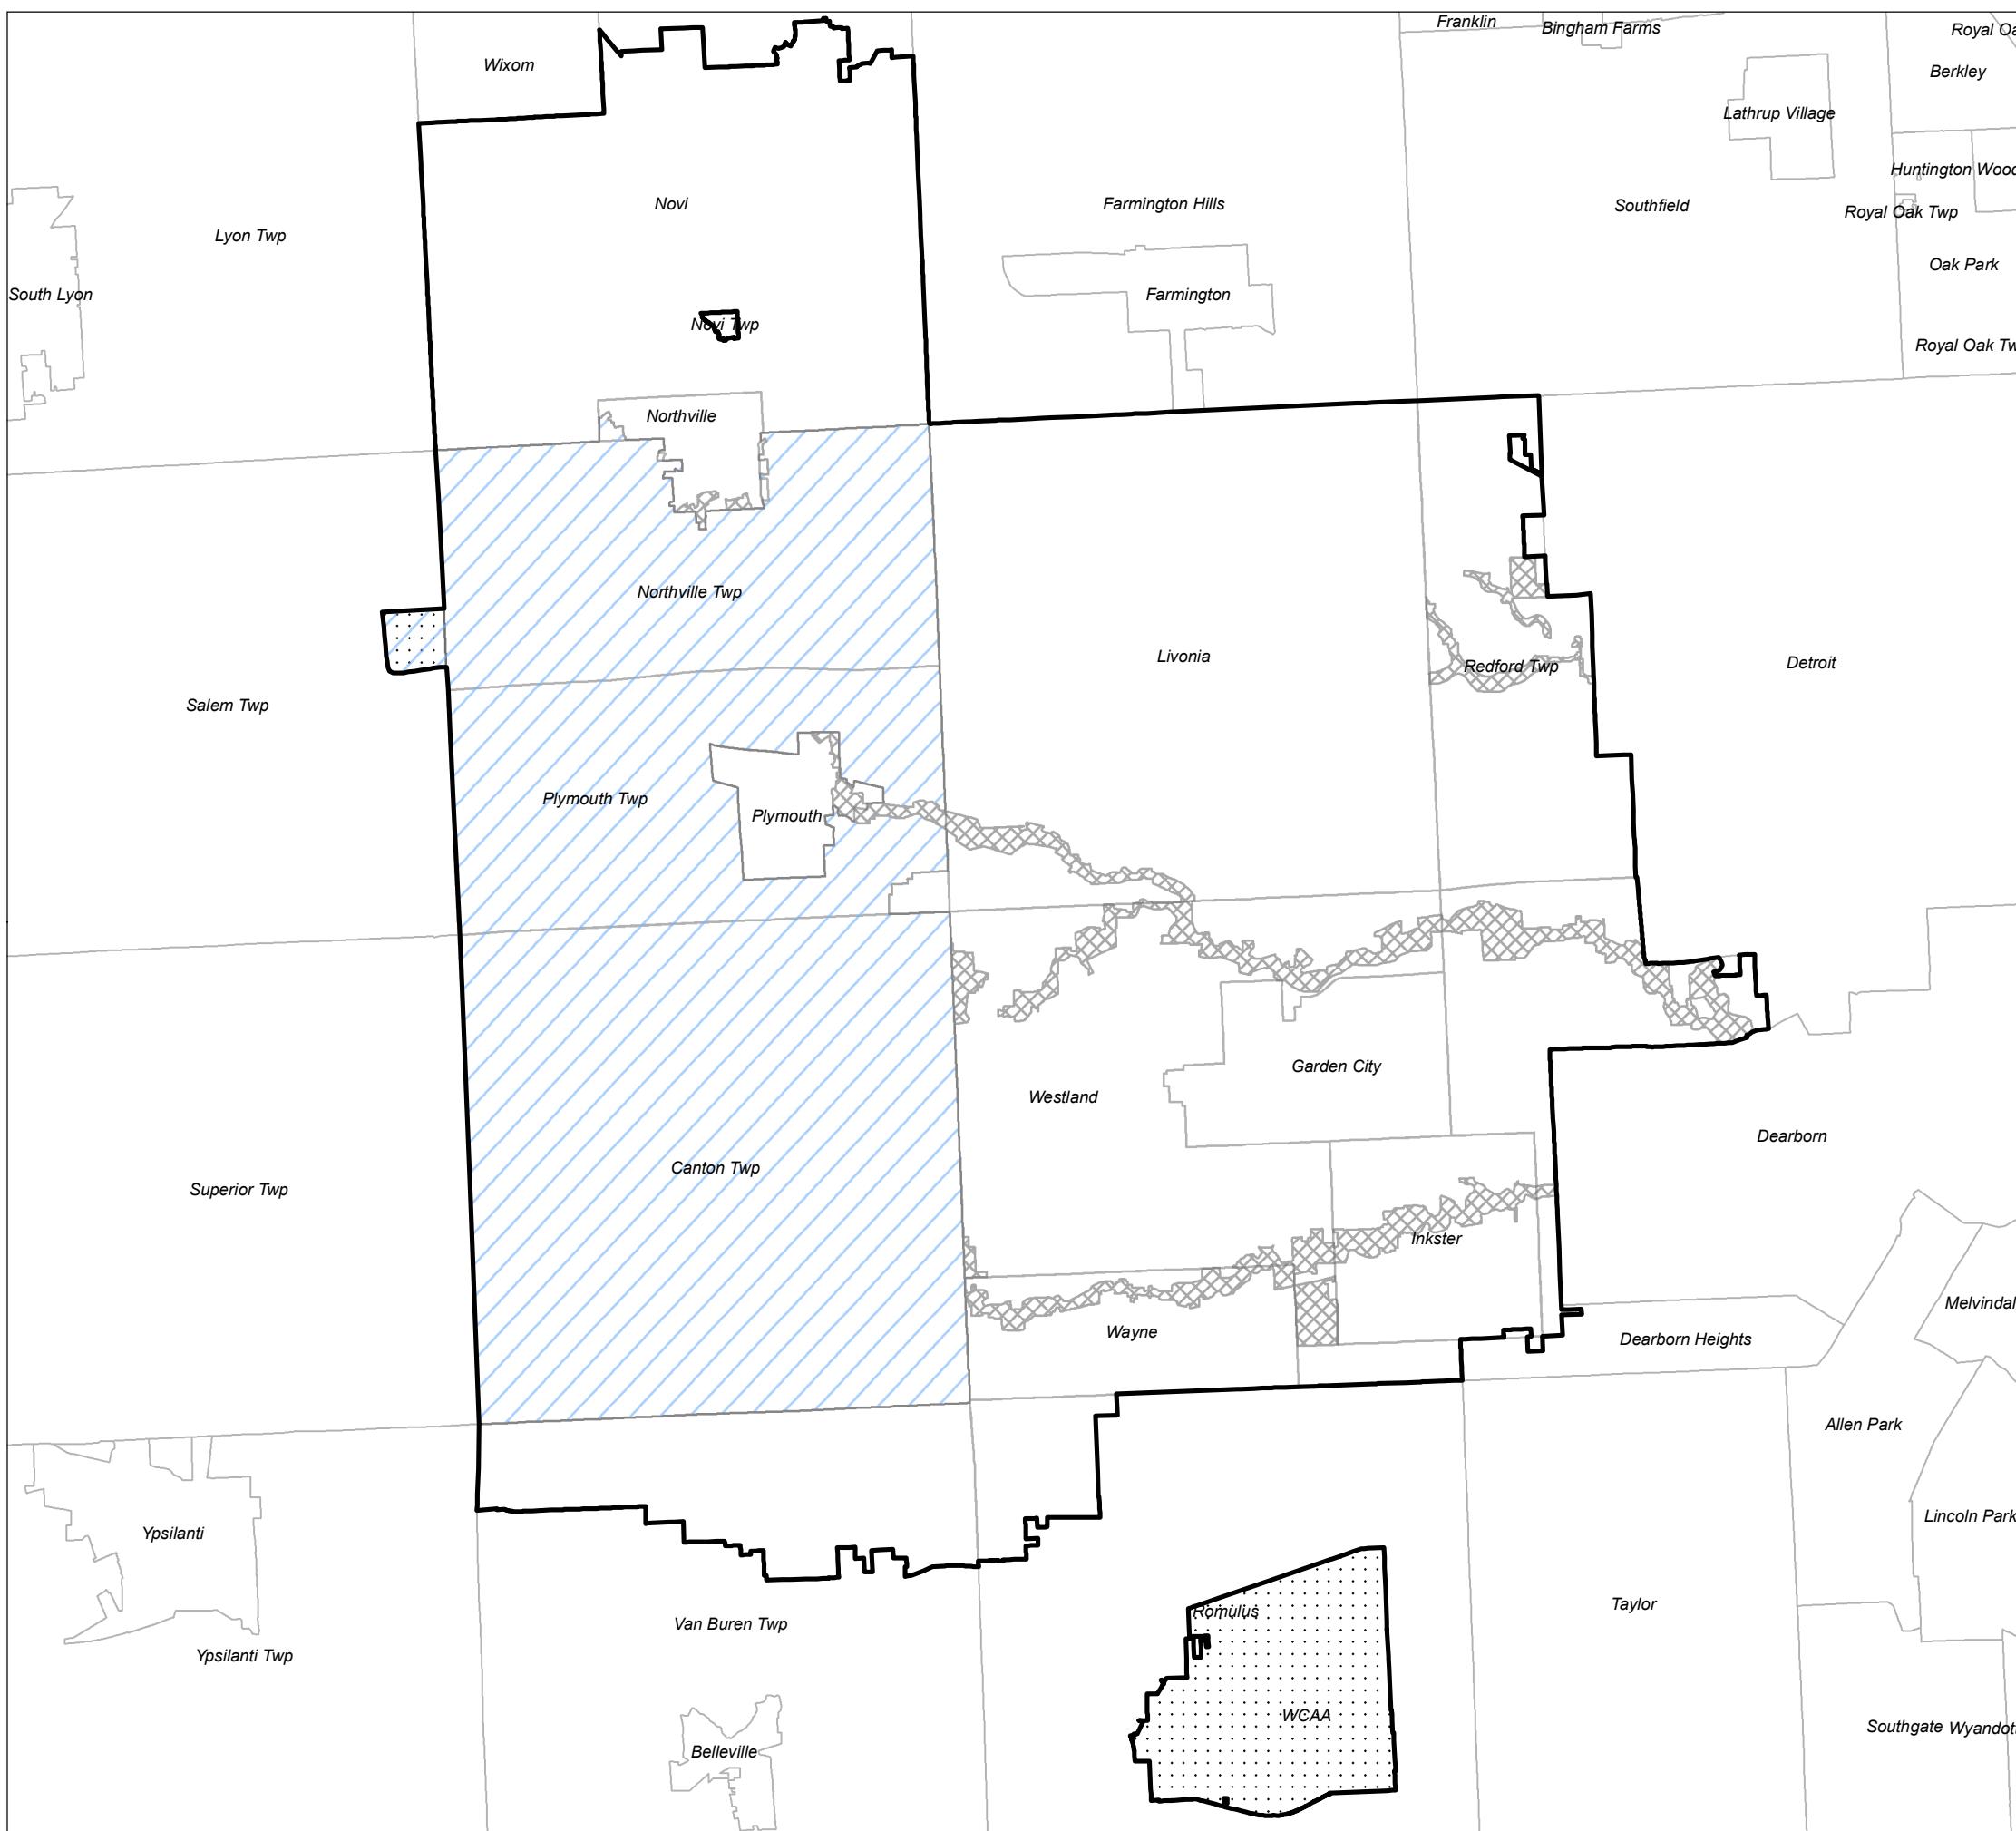

In 2000, the transportation corridor/utilities (TCU) category excluded roads smaller than 275 feet in right-of-way width. Roads that did not meet this threshold were assigned the land use category of their surrounding area. For example, a neighborhood and all the roads within it would be categorized in the 2000 land use data as “single-family residential.” The current SEMCOG 2008 land use data distinguishes a TCU land use category for all roads no matter how small. Thus, for the same neighborhood, the 2008 data now has less “single-family residential” area than in the 2000 data set because the roads within the area are being excluded from the previous tally. Because of these differences between the 2000 and 2008 land use data, change analyses between the two data sets is not possible.

4. REFERENCES/DATA SOURCES
